CONTENTS

CONTENTS (CONTINUED)

1.0 INTRODUCTION

1.1 GENERAL

Lewis Homes (South Wales) Limited are proposing to develop a site at Sandy Lane in Ystradowen for residential end-use.

Intégral Géotechnique (Wales) Limited have been appointed as the Geotechnical Engineers to undertake an intrusive site investigation to enable a geotechnical and geoenvironmental appraisal of the site and provide a basis for design.

This report presents the findings of the intrusive site investigation and gives recommendations for the design of foundations, floor slabs and other geotechnical and geoenvironmental aspects of the project.

This report (including all appendices to it and any subsequent addendums or correspondence) has been prepared for the sole benefit, use and information of Lewis Homes (South Wales) Limited and no third party is entitled or permitted to rely on it. This report may not be used, reproduced or circulated (in whole or part) for any purpose without the written consent of Intégral Géotechnique (Wales) Limited. Intégral Géotechnique (Wales) Limited shall not be liable to any third party who does not have such express written permission to rely on the report for any losses they may suffer.

1.2 PROPOSED DEVELOPMENT

The proposed development will comprise the construction of forty-five residential units, including associated infrastructure such as access roads, car parking areas and private driveways and also areas of landscaping and private gardens.

1.3 SCOPE OF WORKS

The work instructed included a desk study of available information, site reconnaissance and intrusive investigation. This was followed by laboratory testing and geotechnical and geoenvironmental reporting.

The desk study comprised a review of:

- An Envirocheck Report obtained for the site
- Old Ordnance Survey maps covering the site, included within the Envirocheck Report
- A Radon Report obtained from the British Geological Survey (BGS)

1.3 SCOPE OF WORKS (CONTINUED)

- Geological maps of the area provided by the BGS
- the Environment Agency/Natural Resources Wales groundwater vulnerability map and aquifer database for the area.

The desk study information was used to make an initial assessment of the site and to design an intrusive site investigation to be carried out by Intégral Géotechnique. The intrusive site investigation was designed in accordance with BS5930+A2:2010, the Code of Practice for Site Investigations, BS10175:2011, the code of practice for investigation of potentially contaminated sites, and 'Development of Land Affected by Contamination: A Guide for Developers' prepared by Welsh Local Government Association (WLGA)/Natural Resources Wales (NRW) Land Contamination Working Group, 2017.

The intrusive site investigation comprised:

- 18No machine excavated trial pits and 6No windowless sample boreholes
- Soil infiltration testing within 6No trial pits
- Sampling of soil for laboratory chemical and geotechnical testing.

1.4 LIMITATIONS

This document is intended to be a working document for further development in discussion with all concerned including the Local Planning Authority, Natural Resources Wales, and the NHBC as appropriate.

"Contamination" is taken throughout the report to mean the "presence of one or more potentially harmful substances as a result of human activity". The use of the term in this way does not imply that harm is being or might be caused by the contamination. It should be noted that "contamination" can have different meanings under different regulatory regimes, for example, planning, building control and Part IIA of the Environmental Protection Act 1990. Naturally elevated concentrations of potentially harmful substances may also be of concern and the significance of any that have been found is also evaluated in this report.

It is important to recognise that there may be areas of contamination that have not been found, or that contaminants are present at concentrations above those that have been found. It is also important to recognise that contamination may be localised and that no investigation, however comprehensive, is capable of finding such occurrences other than by chance.

1.4 LIMITATIONS (CONTINUED)

It should also be noted that vertical and lateral changes in ground conditions may be present between exploratory hole locations.

It should be noted that the ground surface in the northern half of the site was soft and waterlogged at the time of the intrusive site investigation works and could not be fully investigated by a wheeled excavator. Consequently, additional site investigation works were subsequently carried out by using a tracked excavator.

2.0 THE SITE

2.1 SITE LOCATION AND DESCRIPTION

The site is located off Sandy Lane in the village of Ystradowen approximately 3.8km northeast of Cowbridge at a National Grid Reference of 301560, 177850, see Figure 1.

The site is irregular in shape and occupies an area of approximately 1.6 hectares. The boundaries of the site are defined by Sandy Lane to the southeast, existing properties off Sandy Lane and Badgers Brook Close to the southwest and west, and undeveloped fields to the north and northeast. A site plan is presented in Figure 2.

The site is situated on sloping ground which falls to the north from an approximate maximum elevation of 68m AOD at the entrance gateway off Sandy Lane dropping some 11m in elevation to approximately 57m AOD within the northern corner of the site.

At the time of the site investigation works the site was covered by hummocky grass vegetation. Much of the northern half of the site was notably waterlogged/boggy. Mature trees and hedgerows were present along the northern, western and eastern site boundaries. A hedgerow was present along the southern site boundary forming the site boundary with Sandy Lane.

Although no invasive plant species were observed at the time of the site investigation works, a full vegetation survey should be carried out.

2.2 SITE OPERATIONS

The site is currently undeveloped and utilised for grazing cattle.

2.3 SURROUNDING LAND USE

The surrounding areas are utilised for a combination of residential and agricultural use. Existing established residential developments are located to the south and west and with undeveloped fields to the north and east.

2.4 AVAILABLE SITE INVESTIGATION DATA

There is no available site investigation data to our knowledge.

2.5 CONSULTATIONS WITH REGULATORS

The regulators have not been contacted at this stage.

3.0 SITE HISTORY

The recent history of the site has been traced with the aid of an Envirocheck Report, a copy of which is included in Appendix A. The Envirocheck Report includes the following scaled historical maps:

Map Scale	Dates
1:2,500	1877, 1899, 1919, 1972, 1987, 1989, 1993, 2000(aerial photo)
1:10,560	1885, 1900, 1921, 1947-1952, 1947(aerial photo)
1:10,000	1964, 1974, 1999, 2006, 2019

The earliest edition of the map dated 1877 indicated the site and the surrounding areas to be undeveloped fields. An existing road formed the south eastern boundary of the site. The site was indicated to be the site of a supposed early medieval battle in A.D. 1032. The nearest development at this time was Ffos-y-gwtter located on the opposite side of the road to the southeast of the site. The Cowbridge Branch of the Taff Vale Railway ran within a cutting on a northeast to southwest orientation, approximately 80m to the southeast of the site.

The site remained relatively unchanged and undeveloped over the subsequent years. There was little change to the site or the surrounding area until the edition of the map dated 1972. By this time a new residential development known at St Owains Crescent had been constructed approximately 50m to the southwest of the site. Further residential development had also taken place along the main road, known as Cowbridge Road, which passed through the village. The railway line to the southeast of the site was now indicated to have been dismantled. The site itself remained undeveloped.

Throughout the 1980's and the 1990's residential development continued within Ystradowen to the west. By the edition of the map dated 2000 residential development was indicated up to the western and south western boundaries of the site. By 2016 a new development had been constructed on the opposite side of Sandy Lane to the south of the site.

The site and the area to the north and northeast remained undeveloped up until the present day.

4.0 SITE ENVIRONMENTAL SETTING

4.1 PHYSICAL SETTING

The site is located within the established village of Ystradowen. The site lies on sloping ground which falls to the north from an approximate maximum elevation of 68m AOD at the entrance gateway off Sandy Lane dropping some 11m in elevation to approximately 57m AOD within the northern corner of the site.

4.2 GEOLOGY

The 1:50,000 scale geological map of the area indicates the site to be underlain by Blue Lias Formation (marginal facies) of the Jurassic period. These rocks typically comprise thinly interbedded limestones and calcareous mudstones.

Superficial Devensian Till deposits of the Quaternary period are indicated to overlie the solid strata. These deposits are generally poorly sorted and variable in nature and comprise clays, sands and gravel.

The geological boundary of superficial Head deposits, also of the Quaternary period, are indicated to encroach across the northwest boundary of the site. These deposits are very similar in nature to the Devensian Till deposits.

It should also be noted that superficial Glaciolacustrine deposits are indicated just to the north of the site boundary and there is a possibility that these deposits may underlie parts of the site. Glaciolacustrine deposits were laid down in glacial lakes and typically comprise laminated silt and clay and are often rich in organic matter and can be locally interbedded with peat.

Due to the site being historically undeveloped, a significant thickness of made ground is not anticipated above the superficial deposits across the site. Localised areas particularly on field boundaries or in gateways should not be completely ruled out.

The Envirocheck Report does not indicate any natural cavities on site or within 1km of the site boundary. The potential for ground dissolution stability hazards on site is classified as very low to low by the British Geological Survey.

A summary of the anticipated geological succession is given below in Table 1.

4.2 GEOLOGY (CONTINUED)

Table 1: Summary of Anticipated Site Geology		
Geological unit	**Horizon**	**Description**
Recent	Topsoil/subsoil	Various materials
Quaternary	Devensian Till (possible localised head deposits and glaciolacustrine deposits)	Poorly sorted and variable in nature and comprise clays, sands and gravel (possible locally laminated silt and clay, organic rich, interbedded with peat)
Jurassic	Blue Lias Formation (marginal facies)	Thinly interbedded limestones and calcareous mudstones

4.3 RADON

Information with regard to Radon Protective Measures is provided on the Landmark Radon Information Map as presented in Appendix B. The updated map based on current data indicates that the site is located within an intermediate probability area as between 3% and 5% of properties are above action level, and that therefore basic radon protective measures would be necessary in the construction of new buildings within the site.

4.4 MINING

The site is not located within an area that would be affected by past, present or future underground mining.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK

The Envirocheck Report indicates that the nearest surface water feature is located 40m to the northwest of the site boundary. The OS Water Network Lines map indicates this to be an unnamed surface water feature.

The Environment Agency/Natural Resources Wales groundwater vulnerability map and aquifer database classifies the bedrock beneath the site as a Principal Aquifer. Principal Aquifers are layers of rock or drift deposits that have high inter-granular and/or fracture permeability - meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, principal aquifers are aquifers previously designated as a major aquifer.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

The Environment Agency/Natural Resources Wales groundwater vulnerability map and aquifer database classifies the superficial deposits beneath the site as a Secondary Aquifer-Undifferentiated. This classification has been assigned in cases where it has not been possible to attribute either category A or B to a strata type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the strata type.

A perched water body could be encountered within the granular superficial deposits. Vertical migration of groundwater is likely to be limited by the high clay content of the Devensian Till.

It is considered possible that any existing site drainage could act as a pathway for potential surface contaminants.

There are twelve discharge consents recorded within 500m of the site boundary, one of which is indicated to be on site. The on-site consent was a sewage discharge which has now expired. It is considered that this consent has been incorrectly positioned on site and is actually associated with a filter bed situated approximately 21m to the north of the site.

The nearest effective discharge consents are recorded 72m to the north of the site, there are seven in total. They are all public sewage discharges received by an unnamed stream. The next effective discharge consent is recorded 387m to the northeast of the site and is a sewage discharge received by Nant Dyfrgi.

The Envirocheck Report states that there are no water abstractions recorded within 500m of the site boundary.

Tables 2 and 3 present a summary of the hydrological features and key hydrogeological nature of the site.

4.5 HYDROLOGY, HYDROGEOLOGY AND FLOOD RISK (CONTINUED)

Table 2: Summary of Site Hydrology					
Feature	Distance from site	Flow	Classification	Abstraction	Discharge
Unnamed surface water feature	40m northwest	North easterly	Not known	No	Not known
Surface run-off	On site	Flows on to site or into site drainage if present	N/A	No	Not known
Site Drainage	On site	Not known	N/A	No	Not known

Table 3: Summary of Site Hydrogeology				
Geological Unit	Aquifer Classification	Aquifer Characteristics	Source Protection Zone	Groundwater Abstractions
Made ground	Not classified	Highly variable permeability and porosity. Perched water may be present with variable flow directions.	No	None
Devensian Till	Secondary Aquifer Undifferentiated	Variable low permeability and porosity with intergranular flow possible. High clay content likely to restrict flow.	No	None
Blue Lias Formation (marginal facies)	Principal Aquifer	High permeability limestones and mudstones. High fractures usually provide a high level of water storage	No	None

The Groundwater Vulnerability map of the area indicates that the secondary aquifer is classified as having a high vulnerability. The pollutant speed is high with well-connected fractures in the bedrock.

The Environment Agency/Natural Resources Wales Flood Risk Map as presented within the Envirocheck Report indicates that the site is not at risk to extreme flooding from rivers or sea without defences.

The BGS Groundwater Flooding Susceptibility map indicates that the site has limited potential for groundwater flooding to occur.

4.6 LANDFILL SITES

The Envirocheck Report indicates that there are no BGS recorded, historical or current landfill sites recorded within 1km of the site boundary.

There is one area of potentially infilled land (water) located within 500m of the site boundary. The area is recorded 223m to the west of the site and is at the location of a former pond according to the historical maps.

4.7 POTENTIAL CONTAMINATION

Previous Uses

The various activities in the vicinity of the site which may have resulted in ground or water resource contamination on this site are listed below in Tables 4 and 5. A summary of the potential contaminants can be found in the tables.

Table 4: Potential Contaminants		
Land Use: Undeveloped land until present day		
Material/Process	**Contamination/Hazard**	**Evidence**
Agricultural land	No potential contaminants	Historical maps
Possible localised areas of made ground on field boundaries or in gateways from agricultural activity	Metals, semi metals, non-metals, PAH, asbestos	Anecdotal

Existing Uses

No existing potentially contaminative site uses have been identified.

Adjacent Site Uses

Table 5: Potential Contaminants: Adjacent Site Uses		
Potential Contamination Source	**Boundary**	**Associated Contaminants and Hazards**
Residential	Western and south western	No Potential Contaminants
Sandy Lane with residential development beyond	South eastern	No Potential Contaminants
Undeveloped fields	Northern and north eastern	No Potential Contaminants

4.8 OTHER ENVIRONMENTAL ISSUES

The Envirocheck Report indicates an area of Ancient Woodland to be located 193m to the west of the site. No other environmentally sensitive land is indicated in the vicinity of the site.

The Envirocheck Report indicates that there have been no pollution incidents to controlled waters recorded on site but two recorded within 500m of the site boundary. The incidents were recorded 176m and 181m to the north of the site and they were Category 3-Minor Incidents involving chlorinated water.

There have been no substantiated pollution incidents registered on site or recorded within 1km of the site boundary.

There have been no prosecutions relating to controlled waters or to authorised processes recorded on site or within 1km of the site boundary.

Invasive plants were not noted during the site walkover, but it is recommended that a full vegetation survey is carried out prior to development.

5.0 PRELIMINARY CONCEPTUAL SITE MODEL

5.1 RISK ASSESSMENT FRAMEWORK

In order to be consistent with current UK government policies and legislation, it is necessary to identify, make decisions on, and take appropriate action to deal with land contamination, in accordance with the procedures specified in the Environment Agency document 'Model Procedures for the Management of Land Contamination CLR-11' (Environment Agency 2004).

The risk assessment process is designed to provide a reasoned, structured and pragmatic mechanism for the identification of any potential human health and controlled waters risks associated with land contamination and where necessary to develop a robust remediation strategy to ensure protection of the sensitive receptors (human health of future residents, controlled waters, etc).

In accordance with the CLR-11 framework, risk is defined as:

'a combination of the probability, or frequency, of occurrence of a defined hazard and the magnitude of the consequence of the occurrence'.

The three essential elements to any risk are defined by CLR-11 as follows:

- A contaminant, or hazard, which is in, on, or under the land and has the potential to cause harm (Source)
- A means by which a receptor can be exposed to, or affected by a contaminant or hazard (Pathway)
- A receptor, i.e. something which could be adversely affected by a contaminant or hazard, such as human health or groundwater (Receptor).

In order for there to be a potential risk, all three of the above elements must be present. If there is a source of contamination and a receptor (for example a resident or site user), then there is only a potential risk if there is a pathway linking the two. Such an active pathway is known as a relevant pollutant linkage. It is possible for the same contaminant to be linked to a receptor via a number of pathways, and hence it is important that all relevant pollutant linkages, to both human health and controlled waters, are separately identified on a site in order that a comprehensive conceptual model can be formed and ultimately a robust remediation strategy designed.

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

Current practice during Generic Quantitative Risk Assessment of land affected by contamination is to use generic soil screening values based on the appropriate proposed end use. These usually comprise risk-based Soil Guideline Values (SGVs) or Generic Assessment Criteria (GACs) derived by the Environment Agency's Contaminated Land Exposure Assessment Model (CLEA). The SGVs and the supporting technical guidance were developed in order to assist in the assessment of long-term risk to human health from the exposure to contaminated soils.

Revised Statutory Guidance, published in 2012, to support Part 2A of the Environmental Protection Act 1990, introduced a new four category system for classifying land under Part 2A. Category 1 includes land where the level of risk is clearly unacceptable and Category 4 includes land where the level of risk posed is considered to be acceptably low. Under Part 2A, land would be determined as contaminated if it falls within Categories 1 or 2.

The revised Part 2A Statutory Guidance was accompanied by an Impact Assessment that identified a role for new 'Category 4 Screening Levels' (C4SLs) that would provide a simple test for determining when land is suitable for use and definitely not contaminated land. A Policy Companion Document including the C4SLs was published in March 2014 (England) and May 2014 (Wales).

The C4SLs have been based on the CLEA methodology and derived using the CLEA model, with modified toxicological and exposure parameters. To date, C4SLs have been released for six substances (arsenic, cadmium, chromium (VI), lead, benzo(a)pyrene and benzene).

The C4SLs have been derived on the assumption that where they exist, they will be used as generic screening criteria within generic quantitative risk assessment.

Following publication of the C4SLs, Land Quality Management (LQM), in conjunction with the Chartered Institute for Environmental Health (CIEH) released Suitable 4 Use Levels (S4ULs) in January 2015.

The S4ULs have been derived in accordance with UK legislation, and using a modified version of the Environment Agency's CLEA software. As such, the S4ULs are based on the concept of minimal or tolerable risk as described in Human Health Toxicological Assessment of Contaminants in Soil (Science Report SR2, Environment Agency 2009a).

S4ULs have been derived for a wider number of substances.

5.1 RISK ASSESSMENT FRAMEWORK (CONTINUED)

In addition to the existing SGVs, C4SLs and S4ULs, Atkins ATRISK^{soil} also provide a set of Soil Screening Values. These are currently intended to be used in conjunction with SGVs, although they intend to update these values in line with the C4SLs in due course.

We have reviewed all sets of values and intend to use the most appropriate assessment criteria as Tier 1 screening values in the first instance. Where a published S4UL is available, and considered appropriate, this will be used in the first instance.

5.2 CONCEPTUAL MODEL FRAMEWORK

The preliminary stage of the risk assessment process is to develop and define a conceptual site model, based on the desk study and any existing site investigation data. This is used to establish any potential contaminant sources, identify existing and future receptors and assess if there are any potentially active pathways by which a potential risk may be present.

The preliminary conceptual site model will be developed and refined as site specific data is gathered, such as actual ground conditions and chemical data, resulting in a more robust conceptual understanding of the site.

5.3 CRITICAL SENSITIVE RECEPTOR – HUMAN HEALTH

The proposed redevelopment of the site is for a residential end use. Therefore, the critical sensitive receptor from a human health perspective is an on-site residential receptor.

In accordance with S4UL/C4SL and CLEA guidance for a standard residential with homegrown produce scenario, the critical sensitive receptor for a residential end use risk assessment is a female child, with exposure from 0 to 6 years.

The standard residential with homegrown produce end use conceptual model defined by S4UL/C4SL and CLEA is considered to be suitable for the purposes of this assessment.

5.4 CRITICAL SENSITIVE RECEPTOR – CONTROLLED WATERS

Based on the proposed redevelopment of the site for a residential end use, and the findings of the desk study, the critical sensitive receptor from a controlled water perspective is groundwater within the Principal Aquifer of the Blue Lias Formation (marginal facies).

5.4 CRITICAL SENSITIVE RECEPTOR – CONTROLLED WATERS (CONTINUED)

By considering groundwater as the critical sensitive receptor for controlled waters, the groundwater/hydrogeological risk assessment will also be protective of any nearby surface water features.

5.5 POTENTIAL CONTAMINANT SOURCES

As identified in the desk study, the site has remained undeveloped up until the present day. Significant made ground deposits would not be anticipated within the site but localised areas could be encountered.

If any made ground was encountered, the potential types of contaminants of concern are listed below:

- Metals, semi-metals, and inorganics within the shallow made ground
- Polyaromatic hydrocarbons (PAH) within the shallow made ground
- Asbestos within the shallow made ground.

5.6 POTENTIAL EXPOSURE PATHWAYS

Potential exposure pathways for the critical receptors (both human health and controlled waters) are listed below:

- Dermal contact with soil and/or soil derived dust
- Ingestion of soil and/or soil attached to home-grown produce
- Ingestion of home-grown produce
- Inhalation of soil derived dust
- Inhalation of vapours – indoor and outdoor air
- Leaching of contaminants from made ground to groundwater
- Transportation of contaminants within groundwater.

In addition, the following exposure pathways have also been considered:

- Ground gas generation and migration
- Building materials durability.

5.7 SUMMARY OF CONCEPTUAL EXPOSURE MODEL

A preliminary conceptual exposure model has been developed for the site. This is based on the findings of the desk study and historical review and includes all potential sources, pathways and receptors that may be present on site. Those that have been identified as being potentially active require further investigation in the form of sampling and testing of soils and/or groundwater, followed by appropriate risk assessment.

The preliminary conceptual exposure model will be reviewed and refined following the completion of the site works and laboratory testing.

The preliminary conceptual exposure model is presented below in Table 6.

Table 6: Preliminary Conceptual Exposure Model

Source		Receptor	Pathway	Potentially Active Pathway?
Origin	Contaminant			
Potential localised made ground of unknown origin and historical land uses In situ topsoil and subsoil	Metals, semi-metals, non-metals, PAH, asbestos	Resident – human health	Dermal Contact with made ground/dust	✓
			Ingestion of soil and/or soil attached to home-grown produce	✓
			Ingestion of home-grown produce	✓
			Inhalation of dust	✓
			Inhalation of vapours – indoor/outdoor	✓
	Metals, semi-metals, inorganics, PAH	Groundwater quality	Leaching from made ground	✓
		Surface water quality	Transportation within groundwater	✓
Potential localised made ground of unknown origin and natural ground	pH and water-soluble sulphate	Building Materials Durability	Direct contact	✓
Ground gas – organic, gas producing materials	Methane, carbon dioxide	Human health	Accumulation of gases in confined spaces, and/or migration off site, leading to asphyxiation, or risk of explosion	X Significant thickness of gas generating material not anticipated. No off-site sources identified.

6.0 THE SITE INVESTIGATION

6.1 FIELDWORKS

An intrusive site investigation was designed in accordance with BS5930+A2:2010, the Code of Practice for Site Investigations, BS10175:2011, the Code of Practice for Investigation of Potentially Contaminated Sites, and 'Development of Land Affected by Contamination: A Guide for Developers' prepared by Welsh Local Government Association (WLGA)/Natural Resources Wales (NRW) Land Contamination Working Group, 2017.

The intrusive site investigation was also designed to provide information to support and refine the preliminary conceptual site model/conceptual exposure model.

An initial intrusive investigation comprising 7No trial pits (referenced TP01 to TP06 and TP05-A) was carried out on 05 February 2020 using a wheeled JCB 3CX backhoe excavator. However, it should be noted that the ground surface across the northern half of the site was found to be very soft and waterlogged and access to this area was not possible with a wheeled excavator. As such, further intrusive site investigation works were carried out on the 21 February 2020 comprising a further 11No trial pits (referenced TP07 to TP17) excavated by using a tracked excavator, and 6No windowless sample boreholes (referenced WS01 to WS06).

The trial pits were excavated to a maximum depth of 2.8m below existing ground level (bgl).

Soil infiltration testing was carried out at 6No trial pit locations (see TP03, TP05-A, TP06, TP07, TP08 and TP12). Water was rapidly added to the trial pits from a tractor-towed agricultural bowser and the water level monitored over a period of time.

The windowless sample boreholes were located across the site and drilled to a maximum depth of 5.0m below existing ground level. The purpose of the windowless sample boreholes was to prove the deeper ground conditions and correlate the findings of the trial pitting. In situ strength testing (SPT/CPTs) was carried out at 1m depth intervals in the windowless sample boreholes.

Representative soil samples were taken from the trial pits for laboratory chemical and geotechnical testing and placed in the appropriate sample containers deemed suitable for the analysis required. Strict protocols were adopted during this process to limit the cross contamination of samples.

6.1 FIELDWORKS (CONTINUED)

The fieldworks were supervised by a qualified Geotechnical Engineer from Intégral Géotechnique (Wales) Limited who also logged the trial pits and windowless sample boreholes, monitored the soil infiltration/soakaway tests and prepared their detailed engineering logs in accordance with the requirements of BS5930+A2: 2010. The engineering logs provide descriptions of the materials encountered in accordance with BSEN ISO 14688-1 (2002) and 14689-1 (2003) for soils and rocks respectively.

The approximate locations of the trial pits and windowless sample boreholes are shown on Figure 2, while their logs are presented in Appendices C and D respectively. The results of the soil infiltration tests are presented in Appendix E.

6.2 FIELD OBSERVATIONS

No visual or olfactory evidence of any contamination was observed during the intrusive site investigation works.

6.3 LABORATORY CHEMICAL TESTING

Representative soil samples were taken from the trial pits excavated across the site, stored at the appropriate temperature and dispatched to the laboratories of i2 Analytical for laboratory chemical testing within 24 hours.

The samples were tested for a range of contaminants that reflects the historical use of the site, the findings of the desk study and the preliminary conceptual site model/conceptual exposure model. A list of the soil testing carried out is given below:

Beryllium	Cadmium
Total Chromium	Hexavalent Chromium (VI)
Copper	Lead
Mercury	Nickel
Vanadium	Zinc
Arsenic	Boron
Selenium	Elemental Sulphur
Total Cyanide	Total Sulphate
Sulphide	Water Soluble Sulphate
pH	Monohydric Phenol
Polyaromatic Hydrocarbons (PAH)	Asbestos screen

6.3 LABORATORY CHEMICAL TESTING (CONTINUED)

The results of the soil testing are presented in Appendix F.

6.4 LABORATORY GEOTECHNICAL TESTING

Representative soil samples taken from the trial pits were sent to the laboratories of i2 Analytical for geotechnical testing. The samples were tested for Atterberg Limits in order to determine the volume change potential of the soils.

A copy of the geotechnical test results is presented in Appendix G.

7.0 GROUND CONDITIONS

A summary of the typical ground conditions encountered across the site is presented below in Table 7.

Table 7: Summary of Ground Conditions

Depth (m) From	Depth (m) To	Stratum
0.00	0.15/0.20	TOPSOIL: Soft brown silty CLAY with rootlets.
0.15/0.20	>1.50/>5.00	Variable GLACIAL TILL deposits: Loose or loose to medium dense, becoming medium dense, brown variably clayey variably gravelly fine to medium SAND with variable cobble content. and/or Soft, soft to firm, sometimes firm, orange brown, brown sometimes red brown, variably sandy variably gravelly silty CLAY.
2.50/4.00	3.40/>5.00	Suspected localised GLACIOLACUSTRINE deposits: Soft to firm or firm brown or red brown thinly laminated SILT/CLAY. *Encountered at WS04 and WS05 only.*

A high degree of excavation instability (comprising overbreak and spalling of excavation sides, sometimes resulting in collapse to ground level) was observed during the excavation of the trial pits. Running sand conditions were also noted within a number of the trial pit excavations.

7.1 TOPSOIL

A layer of topsoil, typically between approximately 0.15m and 0.35m thick, was encountered immediately below the ground surface at each exploratory hole location. The encountered topsoil typically comprised soft brown silty clay with rootlets.

7.2 SUPERFICIAL DEPOSITS

Superficial glacial till deposits underlie the topsoil beneath the site. The encountered glacial deposits were recorded to be variable, comprising both granular and cohesive soils with varying degrees of secondary constituents including clay, silt, sand, gravel and cobbles.

7.2 SUPERFICIAL DEPOSITS (CONTINUED)

The base of the superficial deposits was not proven within the exploratory holes which were terminated at depths ranging between approximately 1.50m bgl and 5.00m bgl.

The encountered granular superficial deposits typically comprised loose or loose to medium dense, becoming medium dense, brown variably clayey variably gravelly fine to medium sand with variable cobble content. Running sand conditions (and associated fast groundwater inflows) were recorded within these deposits at TP09, TP10, TP11, TP16 and TP17. Highly variable SPT N values were recorded within the granular soils, ranging between 4 and 47.

The encountered cohesive superficial deposits typically comprised soft, soft to firm, sometimes firm, orange brown, brown, and sometimes red brown, variably sandy variably gravelly silty clay. Hand Shear Vane (HSV) testing recorded undrained shear strength values ranging between approximately 30kPa and 50kPa within the cohesive deposits.

Suspected glaciolacustrine deposits were encountered in WS04 and WS05 from approximately 2.50/4.00m bgl. These deposits comprised soft to firm or firm brown or red brown thinly laminated silt/clay.

Due to the variable physical nature of the superficial deposits underlying the site, the encountered strata recorded within the depths of the trial pits would often change from a cohesive to a granular soil over short lateral and vertical distances.

The laboratory plasticity test results indicate that the superficial deposits underlying the site have plasticity indices ranging between non-plastic (NP) and 15%. The modified plasticity indices range between non-plastic (NP) and 11%, indicating that the volume change potential of superficial soils underlying the site ranges between non-shrinkable to low.

7.3 GROUNDWATER

Shallow groundwater was encountered within the superficial deposits beneath the site.

The presence of groundwater and the loose nature of the granular soils frequently resulted in significant spalling / collapse of excavation sides and running sand conditions within a number of trial pit excavations.

A summary of the encountered groundwater depths and locations is presented in Table 8.

7.3 GROUNDWATER (CONTINUED)

Table 8: Summary of Encountered Groundwater

Exploratory Hole Reference	Groundwater Depth (m bgl)	Comments
TP01	2.6m bgl	Moderate seepage
TP04	2.1m bgl	Moderate seepage
TP05	1.6m bgl	Moderate seepage
TP05-A	1.5m bgl	Moderate seepage
TP06	1.3m bgl	No seepage but strata notably damp/wet below 1.3m bgl.
TP08	1.0m bgl	No seepage but strata notably damp/wet below 1.0m bgl.
TP09	1.0m bgl	Fast inflow with associated running sands.
TP10	0.9m bgl	Fast inflow with associated running sands.
TP11	0.9m bgl	Fast inflow with associated running sands.
TP14	2.4m bgl	Fast inflow with associated running sands.
TP16	1.4m bgl	Fast inflow with associated running sands.
TP17	1.7m bgl	Moderate inflow with associated running sands.

Groundwater was also encountered within the windowless sample boreholes at depths ranging between approximately 2.1m and 3.0m bgl.

The groundwater conditions are based on observations made at the time of the fieldwork. It should be noted that groundwater levels may vary due to seasonal and other effects.

7.4 SOIL INFILTRATION TESTS

Soil infiltration testing was carried out at 6No locations across the site in trial pits TP03, TP06, TP05-A, TP07, TP08 and TP12.

The trial pits were rapidly filled with water from a tractor-towed agricultural bowser and the water level monitored over a period of time. Where infiltration and time allowed, repeat cycle tests were carried out in general accordance with BRE365.

The results of the soakaway testing are summarised below and presented in Appendix E. A summary of the results is presented in Table 9.

Table 9: Summary of Soil Infiltration Test Results

Test Location	Test Depth (m bgl)	Soil Infiltration Rate (m/s)		
		Test Cycle 1	Test Cycle 2	Test Cycle 3
TP03	2.6	$7.0x10^{-6}$	n/a	n/a
TP06	2.1	$7.4x10^{-6}$	n/a	n/a
TP05-A	1.5*	$1.2x10^{-5}$	n/a	n/a
TP07	1.7	$2.1x10^{-5}$	$2.1x10^{-5}$	n/a
TP08	1.4	$8.2x10^{-6}$	n/a	n/a
TP12	2.0	$7.9x10^{-6}$	n/a	n/a

* It should be noted that the sides of the excavation in TP05-A collapsed during the soakaway test from 1.50m back up to 0.80m bgl. The soakaway test was continued and a soil infiltration rate of $1.2x10^{-5}$ m/s was calculated. This result should be used with caution.

The results indicate a range in soil infiltration rates of between $2.1x10^{-5}$ m/s and $7.0x10^{-6}$ m/s.

It should be noted that the results of the soil infiltration testing had to be extrapolated in order to determine the soil infiltration rates, and therefore actual infiltration may vary. It should also be noted that the soakaway test results are specific to the locations and depths of the tests undertaken.

It should be noted that this initial testing should only be regarded as indicative. If it should be proposed to use soakaways for this site, then more extensive location and depth specific follow-up tests will be required and should fully comply with BRE 365, in order to confirm the suitability of the site and to satisfy the local authority.

8.0 CONTAMINATION

8.1 AVERAGING AREAS

In order to assess the laboratory test results reliably and in context, the data have been grouped into an averaging area. An averaging area (or area of interest) is that area of soil to which a receptor is exposed or which otherwise contributes to the creation of hazardous conditions. This may be an area of historical industrial usage, a soil type, or a specific proposed end use.

In the case of this analysis, a site wide averaging area has been determined according to the proposed residential end use.

8.2 SOIL CONTAMINATION

The Suitable 4 Use Levels (S4ULs) derived by LQM for a residential with homegrown produce end use have been adopted as critical concentrations against which soil contaminant concentrations can be compared. In the absence of additional published S4ULs, the Category 4 Screening Levels (C4SLs) published by DEFRA, Soil Guideline Values (SGVs) and Soil Screening Values (SSVs) derived by Atkins ATRISK^{soil} for a residential with the consumption of home grown produce end use have been adopted, where considered appropriate.

Since the results of the testing indicate total organic carbon content (TOC) in the range of 0.3% to 3.2%, the results have been compared to the respective guidelines, where applicable, for 1% soil organic matter content.

The soil test results for topsoil and subsoil have been summarised and are shown in Appendix H.

8.2.1 Topsoil & Subsoil

The results of the laboratory testing carried out on two representative samples of topsoil and two representative samples of subsoil indicate that most of the analysed chemical elements or compounds are present at concentrations below the appropriate thresholds. However, the initial screening indicates a localised exceedance of a number of speciated polyaromatic hydrocarbon (PAH) compounds at one location only.

Asbestos was not detected within any of the samples tested.

8.2 SOIL CONTAMINATION (CONTINUED)

Elevated concentrations of the PAH compounds benzo(a)pyrene, benzo(b)fluoranthene and dibenzo(a,h)anthracene were detected within the subsoil at 0.4m depth at the location of trial pit TP03. It should be noted that elevated concentrations were not detected within the overlying topsoil. It should also be noted that there were no obvious visual indications of a potential source of PAH contamination, such as ash or charcoal from a former fire.

The identified PAH contamination was therefore considered a possible anomalous result and four further soil samples (referred to as TP03A, TP03B, TP03C and TP03D) were obtained from around the location of TP03 from the same depth (0.4m bgl) and tested for PAH compounds only.

The results of the further testing have not identified any elevated PAH concentrations.

9.0 REVISED CONCEPTUAL EXPOSURE MODEL

The preliminary conceptual exposure model has been reviewed and revised to reflect the findings of the intrusive site investigation and the results of the laboratory testing of soils. Pathways identified as a relevant pollutant linkage require appropriate risk assessment or mitigation measures (see Section 10).

Table 10: Revised Conceptual Exposure Model

Source		Receptor	Pathway	Preliminary Active Pathway? (see Sect. 5.8)	Relevant Pollutant Linkage	Justification/ Mitigation
Origin	Contaminant					
Potential localised made ground of unknown origin and historical land uses In situ topsoil and subsoil	Metals, semi-metals, non-metals, PAH, asbestos	Resident – human health	Dermal Contact with made ground/dust	✓	X	No significantly elevated concentrations identified.
			Ingestion of soil and/or soil attached to home-grown produce	✓	X	
			Ingestion of home-grown produce	✓	X	
			Inhalation of dust	✓	X	
			Inhalation of vapours – indoor/outdoor	✓	X	No sufficiently volatile contaminants identified.
	Metals, semi-metals, inorganics, PAH	Groundwater quality	Leaching from made ground	✓	X	No sources of contamination identified.
		Surface water quality	Transportation within groundwater	✓	X	No sources of contamination identified.

9.0 REVISED CONCEPTUAL EXPOSURE MODEL (CONTINUED)

Source		Receptor	Pathway	Preliminary Active Pathway?	Relevant Pollutant Linkage	Justification/ Mitigation
Origin	Contaminant					
Potential localised made ground of unknown origin and natural ground	pH and water-soluble sulphate	Building Materials Durability	Direct contact	✓	✓	Building materials will be in contact with natural ground – risk assess
Ground gas – organic, gas producing materials	Methane, carbon dioxide	Human health	Accumulation of gases in confined spaces, and/or migration off site, leading to asphyxiation, or risk of explosion	X	X	Potential gas producing materials not identified. No off-site sources identified – risk assess

10.0 RISK ASSESSMENT

10.1 METHODOLOGY

The risk of pollution, health effects or environmental harm occurring as a result of ground contamination is dependent upon three principal factors:

- The scale of the contamination sources;
- The presence of sensitive “receptors,” eg Humans: health of the general public, site occupiers, redevelopment workers. Environment: flora, fauna, etc;
- The existence of migration pathways by which contaminants can reach the sensitive receptors.

This section assesses each of these factors in order to evaluate the overall level of risk and potential harm to receptors. The receptor may be human, a water resource, an eco-system or construction materials. Pathways connecting a perceived hazard to a receptor are referred to as exposure pathways.

The sources of contamination and the links connecting the hazards to the sensitive receptors will represent the basis for the risk assessment.

10.2 SOURCE-PATHWAY-RECEPTOR MODEL

The preliminary conceptual site model was based on the findings of the desk study. This was later reviewed and refined according to the findings of the site investigation, allowing for the ground conditions encountered and the results of laboratory testing of soil and groundwater. Any pathways considered to be inactive were removed from the model and all remaining potentially active pathways require risk assessment.

The pathways shown as potentially active in the Revised Conceptual Site Model in Section 9.0 above have been assessed below.

10.3 HUMAN HEALTH RISK ASSESSMENT

10.3.1 Site in its Present Condition

The site does not pose any risks to casual visitors or trespassers. The site is an undeveloped field used for grazing livestock.

10.3 HUMAN HEALTH RISK ASSESSMENT (CONTINUED)

10.3.2 Future Site Users

The contamination test results, and investigation observations do not show significantly elevated concentrations within the topsoil and subsoil beneath the site.

Although slightly elevated PAH concentrations were identified within the subsoil at 0.4m depth in one location, the results of additional testing carried out around this location did not identify any elevated concentrations. Based on the results of the testing, the lack of a potential contaminant source and the agricultural site history, with no history of any previous development, it is considered that the initial result may be considered an anomaly.

It is therefore considered that the site does not present a significant risk to end users and no specific remedial mitigation measures are required.

10.3.3 Construction Workers

Normal good hygiene practices should be adequate to protect the health and safety of redevelopment workers, and should include:

- Minimum handling of materials;
- Washing of hands prior to all meal breaks, which should be taken in a designated clean area;
- The use of standard protective clothing such as boots and overalls and gloves, where considered relevant.

In dry weather, inhalation of dust and gases should be avoided preferably by the use of dust suppression techniques to minimise fugitive emissions and minimisation of exposed materials at any particular time.

All excavations should be regularly checked for safe atmospheres.

Additionally, a system should be established by which any ‘unusual’ materials that may be encountered are reported rapidly to the site management, so that the appropriate action may be taken, following specialist advice if necessary. An unusual material may be identified on site by colour, odour or physical nature.

Reference should be made to the Health and Safety Executive document “Protection of Workers and the General Public during the development of contaminated land” for detailed guidance on these matters.

10.4 RISKS TO VEGETATION

The concentrations of phytotoxic metals in the topsoil and subsoil do not indicate the potential for adverse effects to vegetation. All gardens and areas of soft landscaping will require provision of a minimum thickness of 150mm of clean topsoil.

10.5 GROUNDWATER RISK ASSESSMENT

The site does not have a history of any previous development and has remained in agricultural use. Similarly, the results of the testing of representative samples of the topsoil and subsoil have not identified any significant levels of contamination.

It is therefore considered that the site does not present a potential risk to groundwater/controlled waters.

10.6 GROUND GAS RISK ASSESSMENT

Ground gas monitoring has not been carried out at the site.

However, the historical use of the site as agricultural land, without any previous development, the lack of any on site and/or offsite sources of potential ground gas, and the nature of the underlying soils encountered, including only natural in situ soils without any made ground or potentially organic rich materials, indicate that the site is not at risk from ground gas and no specific ground gas protective measures are required.

Information with regard to Radon Protective Measures is provided on the Landmark Radon Information Map as presented in Appendix B. The site would require basic radon protective measures.

10.7 RISKS TO BUILDINGS AND MATERIALS DURABILITY

10.7.1 Concrete Classification

A summary of the laboratory chemical test results for the chemicals water soluble sulphate, and pH, which may adversely affect the durability of building materials is presented in Appendices G and H.

In accordance with BRE Digest SD1:2005 and adopting the assessment procedure specified therein for greenfield sites, the laboratory chemical test results indicate a characteristic value (taking the highest test result) for water soluble sulphate within the natural ground of 27.0mg/l.

10.7 RISKS TO BUILDINGS AND MATERIALS DURABILITY (CONTINUED)

Using Table C2 of BRE Digest SD1:2005, this characteristic value corresponds to Design Sulphate Class DS-1.

The groundwater regime of the site has been assessed as 'mobile' and a characteristic pH value within the natural ground of 5.7 has been determined (adopting the lowest test result). The Design Sulphate Class has been modified to give a site ACEC class of AC-1 for concrete structures constructed within the natural ground.

10.7.2 Water Services

Water supply pipes will need to be protected from any contamination present within the ground. In particular, the presence of organic contaminants should be addressed when selecting pipe materials. Based on the results of the soil contamination testing, measures to protect pipes will likely comprise clean backfill to trenches.

10.8 WASTE DISPOSAL

Excavated materials generated by the development may be considered as waste and subject to waste controls. Any re-use of excavated materials on-site should be undertaken in accordance with current waste and environmental legislation and which may require the production of an approved Materials Management Plan (MMP) prepared in accordance with the CL:AIRE Code of Practice.

It is recommended that a sustainable development strategy is adopted which reduces to a practicable minimum the generation of waste materials and the need for disposal to a licensed tip. Emphasis should be on recovery and re-use rather than disposal.

However, any waste or surplus materials that are generated will need to be classified in accordance with current EC regulations and Environment Agency guidance prior to disposal. It is the responsibility of the waste producer to classify the waste.

Based on the data obtained from the site investigation works, any waste materials comprising of the existing natural ground are likely to be classified as non-hazardous waste.

Any asbestos containing materials (ACMs) will be classified as hazardous waste.

This classification is provisional and indicative of the likely waste classification based on the data obtained to date (including chemical composition, moisture content, etc.). It also assumes that the materials tested will be representative of future generated waste.

10.8 WASTE DISPOSAL (CONTINUED)

In order to minimise disposal, the materials generated should be segregated and examined, with appropriate testing as necessary, to enable the materials to be sorted or treated into lower classifications, with the resultant benefit of potentially generating re-use rather than disposal.

Once final waste sources and volumes are known, the waste stockpile to be disposed off-site will need to be classified in accordance with Environment Agency/Natural Resources Wales Waste Classification – Guidance on the Classification and Assessment of Waste Technical Guidance WM3 (2015). This is likely to require additional sampling and testing of the generated waste materials to provide an up-to-date current basis for classification.

Depending on the waste classification, waste acceptance criteria (WAC) testing may be required, in order to determine which class of landfill site the waste can be sent to. It is recommended that the results of the waste classification and any WAC test results are sent to the intended licensed waste operator prior to disposal in order to confirm their classification and acceptance.

10.9 UNCERTAINTIES

It is important to recognise that there may be areas of contamination within the site that have not been found or that contaminants may be present at concentrations above those that have been found.

It is also important to recognise that contamination may be localised and that no investigation, however comprehensive, is capable of finding such occurrences, other than by chance.

The near-surface drainage patterns have not been fully established.

11.0 ENGINEERING CONSIDERATIONS AND RECOMMENDATIONS

11.1 DETAILS OF PROPOSED DEVELOPMENT

The proposed development will comprise the construction of forty-five residential units, including associated infrastructure such as access roads, car parking areas and private driveways and also areas of landscaping and private gardens.

The following recommendations should be reviewed once the development layout, engineering levels and the extent of any required cut and fill earthworks are confirmed.

11.2 SITE PREPARATION

Prior to any works commencing on site, the locations of any services should be established and either relocated or protected. Any diversion works should be carried out under the supervision, and to the specification, of the appropriate statutory authorities. Any resulting excavations should be backfilled with suitable fill materials.

Dense vegetation surrounds the majority of the site, comprising mature trees and hedgerows along the north, west and part of the eastern boundary, and hedgerows along the southern and part of the eastern boundary. Although Japanese Knotweed was not observed at the site at the time of the site works, it is recommended that a full vegetation survey of the site is carried out. Any areas where invasive plant species are identified should undergo appropriate treatment/eradication by a specialist contractor.

There are a number of mature trees/hedges along the edges of the site. Allowances should be made for the removal of any associated roots that may become exposed in any proposed nearby earthworks and foundation excavations. Any such works should be conducted in accordance with the code of practice recommended by the National House Building Council (NHBC).

All protection orders relating to existing vegetation/ecology should be adhered to during the development of the site.

All existing topsoil should be stripped off from beneath the proposed buildings and access roads. These excavated materials will be unacceptable as structural fill and should be stockpiled for re-use in landscaped areas and gardens, with any surplus materials being removed from site.

11.2 SITE PREPARATION (CONTINUED)

Exposed formations should be protected from site traffic and inclement weather in order to preserve their integrity. Any soft spots/areas should be removed and replaced with well compacted site won or imported granular fill material.

A system should be established by which any 'unusual' materials that may be encountered are reported rapidly to the site management so that appropriate action can be taken following specialist advice if necessary. Any unusual material may be identified on site by colour, odour or physical nature.

The site slopes down towards the north and cut and fill earthworks will likely be required in order to create suitable development plateaux.

If any fill is to be placed onto an existing sloping area, then the original ground should be adequately cut and benched, in order to prevent the possibility of slippage at the interface between the new fill and the original ground. All works should be carried out in accordance with the DTp Specification for Highways Works.

Any cut and/or fill slopes should be no steeper than 1v in 2h. Cut off drains should be provided at the top and French drains at the bottom of any cut and/or fill slopes. In areas of cut and/or fill, the slopes should be topsoiled and seeded with grass, in order to minimise any future maintenance problems caused by surface water run-offs.

The existing in situ soils are considered to be suitable for re-use as structural fill, subject to appropriate handling. Any shortfall in fill quantities should be made up with clean, inert, imported granular materials in accordance with an agreed specification. These materials will need to be placed and compacted in accordance with the DTp Specification for Highways Works.

Any reduced formations should be brought back up to the required level with granular fill materials. All fill materials should be placed and well compacted in layers, in accordance with Department of Transport Specification for Highway Works.

Some surface and groundwater management will be required in order to ensure the protection of the earthworks and materials. Surface water protective measures should be implemented to prevent surface water run-off leaving the site.

11.3 FOUNDATIONS AND FLOOR SLABS

Given the high variability and the generally low shear strength/density of the shallow superficial deposits underlying the site, conventional strip/trench fill foundations are not considered suitable for the proposed development due to the potential for unacceptable levels of total and / or differential settlements.

Additionally, a shallow groundwater table and excavation instability issues (including significant spalling/collapse of excavation sides and running sand conditions) were recorded during the excavation of the trial pits. As such difficulties in controlling groundwater inflows and excavation sides should be anticipated during construction.

Considering the geotechnical constraints outlined above, a number of potential foundation solutions have been considered, as outlined below. The following foundation recommendations will require a review once the final development layout and engineering levels have been confirmed.

11.3.1 Raft Foundations

Based on the ground conditions encountered during the intrusive site investigation, a lightly loaded raft foundation solution is considered to be the most suitable foundation solution for the proposed development.

Following site strip and proof rolling of formations, it is considered that the proposed raft foundations could either bear onto the existing natural superficial soils or suitably prepared engineered fill.

To minimise the potential for differential movements, it is recommended that beneath the raft foundations there should be a suitably thick layer of well compacted imported granular fill throughout the plan area of the building. Department of Transport Type 1 Sub-base, or similar approved, could be used and should be compacted in layers in accordance with current DTp Specification for Highway Works.

Subject to the results of confirmatory plate load testing on prepared formations, the proposed rafts should be designed to an allowable maximum bearing pressure of 50kN/m^2, with an average pressure of less than 30kN/m^2. At this intensity of loading, the total settlements should not exceed 30mm and any angular distortions caused by differential movements should be less than 1:750. Rafts should be designed to span a 1.0m soft spot and 1.0m cantilever at build corners.

All foundations should be designed for low shrinkability tree influence criteria in accordance with NHBC guidelines.

11.3 FOUNDATIONS AND FLOOR SLABS (CONTINUED)

All formations should be proof rolled with any soft spots and / or any obstructions that could form hard spots removed.

Thickening of the raft is likely to be required beneath the load bearing walls/columns.

Information with regard to Radon Protective Measures is provided on the Radon Information Map and allowances should be made for basic radon protective measures across the site.

11.3.2 Vibro-Stone Columns

Alternatively, it is considered that the proposed buildings could be founded using reinforced strip/trench fill foundations bearing onto improved ground using vibro-stone columns, subject to controlling groundwater inflows into excavations.

Ground improvement using vibro-stone columns would involve the construction of closely spaced stone columns beneath the proposed buildings. The aim is to ensure 'stiffening' of the ground, thereby spreading and dissipating the new development loads in order to minimise total and differential settlements within the underlying soils.

The advice of a specialist vibro-compaction contractor should be sought in order to fully explore the precise bearing capacities which can reasonably be achieved. It should be noted that vibro contractors generally will not treat areas of recently placed cohesive fill material, so an idea of cut and fill levels is advised prior to seeking the advice of a specialist.

Based on the encountered ground conditions (i.e. the presence of loose/soft, collapsible superficial soils and a shallow groundwater table) it is recommended that ‘bottom feed’ vibro techniques are used.

Allowances should be made by the vibro contractor for carrying out suitable in-situ strength testing of the prepared formations.

Upon completion of the vibro-stone columns, buildings may be founded on reinforced strip/trench fill foundations designed in line with design requirements of the specialist vibro contractor. Allowances should be made for shallow groundwater inflows and potential excavation instability / localised running sand conditions.

Foundations should penetrate the founding strata by a minimum of 200mm and be at a minimum depth of 900mm below development level in order to protect against the effects of frost heave and/or thermal shrinkage.

11.3 FOUNDATIONS AND FLOOR SLABS (CONTINUED)

Footings should be deepened in accordance with NHBC guidance for foundations constructed within low volume change potential soils adjacent to mature trees and hedgerows.

Floor slabs should be designed as suspended incorporating appropriate basic radon protective measures.

11.4 EXCAVATIONS AND FORMATIONS

Excavations should be possible with normal soil excavating machinery, without the use of hydraulic breaker attachments.

Based on the findings of the site investigation works, excavations below 1.5 to 2.0m depth are likely to encounter groundwater inflows.

Locally, running sand conditions and significant excavation instability were noted during the intrusive site investigation. Allowances should be made for these constraints during construction.

Allowances should be made for overbreak and spalling/collapse in the sides of the excavations and for the requirement for increased volumes of concrete.

The sides of excavations deeper than 1.0m should be supported by trench boxes or temporarily battered at gradients of typically 30°.

The exposed formations within the in-situ materials will be extremely susceptible to damage, softening and deterioration by wet weather and site traffic. They should therefore be protected by blinding concrete or a 100mm thick layer of hard-core immediately after exposure.

11.5 ACCESS ROADS AND CAR PARKING AREAS

For access roads and car parking areas, a California Bearing Ratio (CBR) value of between 2% and 4% could be assumed for pavement formations within the shallow soils. The design CBR could be increased to greater than 5% if the pavement formations are within well compacted granular fill materials.

11.5 ACCESS ROADS AND CAR PARKING AREAS (CONTINUED)

After proof rolling, the pavement formations, any 'soft spots/areas' and any obstructions that could form hard spots should be removed and replaced with well-compacted imported granular materials. Department of Transport (DTp) Type 1 Sub-Base, or similar approved, could be used and should be compacted in layers in accordance with the current DTp Specification for Highway Works.

Formations within cohesive deposits should be regarded as frost susceptible.

11.6 DRAINAGE

Soil infiltration testing has been undertaken at 6 No. trial pit locations across the site (TP03, TP06, TP05-A, TP07, TP08 and TP12), as indicated on Figure 2.

The results of soakaway tests are summarised in Section 7.3 above (see Table 9).

It should be noted that the sides of the excavation in TP05-A collapsed during the soakaway test and it was not possible to calculate a soil infiltration rate.

The results indicate a range in soil infiltration rates of between 2.1×10^{-5} m/s and 7.0×10^{-6} m/s.

Note that the soakaway test results are specific to the locations and depths of the tests undertaken. The soakaway results should be provided to a suitably qualified drainage engineer so that a soakaway design specific to the development can be completed and provided.

It should be noted that this initial testing should only be regarded as indicative. If it should be proposed to use soakaways for this site, then more extensive location and depth specific follow-up tests will be required and should fully comply with BRE 365, in order to confirm the suitability of the site and to satisfy the local authority.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Geology 1:50,000 Maps Coverage

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

VectorMap Local

Published 2019

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Glamorganshire

Published 1877

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs

Published 1987

Source map scale - 1:2,500

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1993

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Intégral Géotechnique

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Map data

British Geological Survey
NATURAL ENVIRONMENT RESEARCH COUNCIL

Cyfoeth Naturiol Cymru
Natural Resources Wales

Envirocheck reports are compiled from 136 different sources of data.

APPENDIX E

SOIL INFILTRATION TEST RESULTS

BRE365 SOIL INFILTRATION RATE TEST - TP03

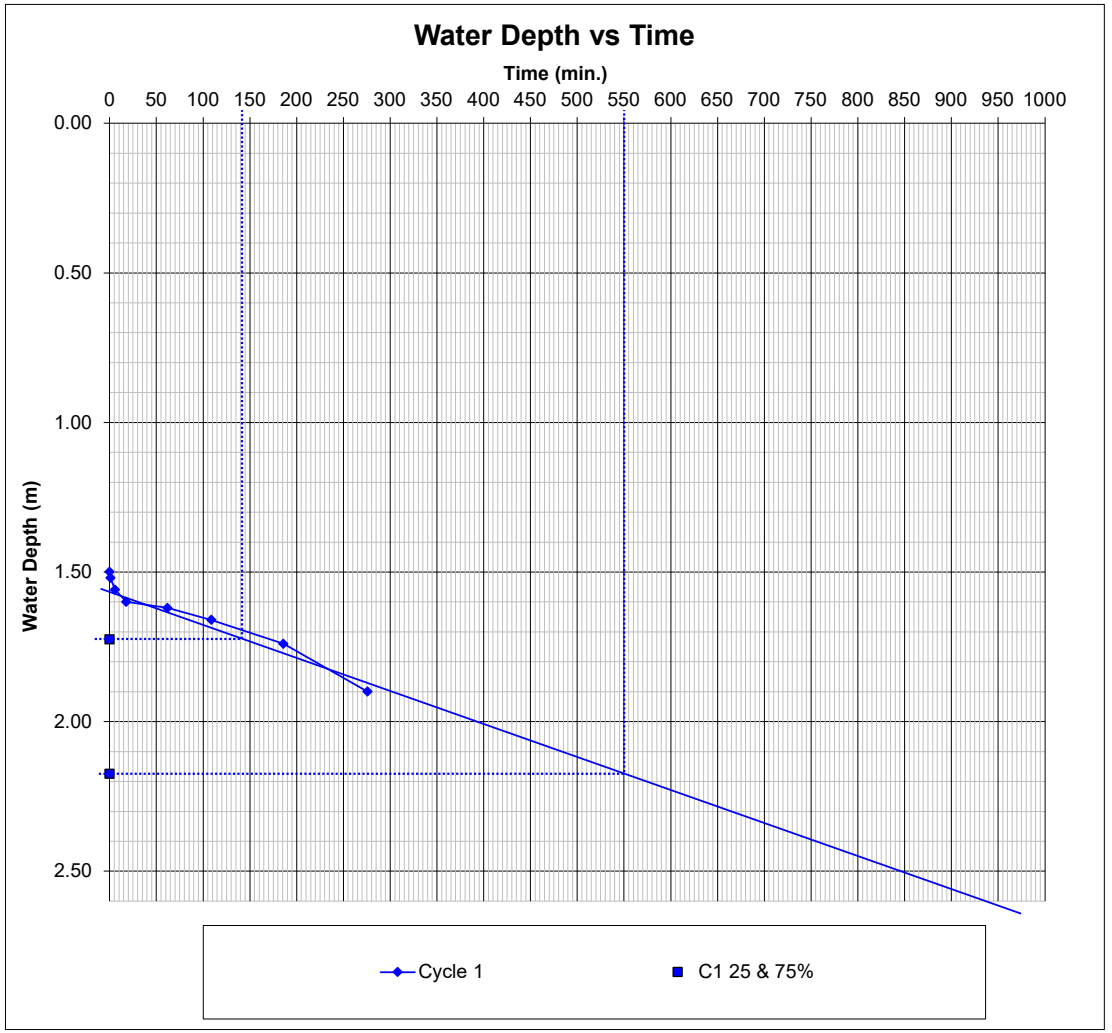
12604 Sandy Lane, Ystradowen

Trial Pit Information	
Length (m)	2.80
Width (m)	0.70
Depth (m)	2.60
Groundwater	Dry
Weather Conditions	Dry
Date	05-Feb-20

Remarks
Spalling of pit sides
Note trendline extrapolated in order to derive soil infiltration rate
Actual infiltration over the same time period may vary
Unable to complete second and third test cycles in the time available

Cycle 1		Cycle 2		Cycle 3	
Time (min)	Depth (m)	Time (min)	Depth (m)	Time (min)	Depth (m)
0	1.50				
1	1.52				
6	1.56				
18	1.60				
62	1.62				
109	1.66				
186	1.74				
276	1.90				

Final Excavation Depth (m)	Cycle 1	Cycle 2	Cycle 3
At end of testing cycle	2.40		
Water Depths (m)			
Water depth at start of test	1.50		
Water depth at end of test	1.90		
Effective depth (measured)	0.40		
% Effective storage depth	0.44		
Effective Storage Depths (m)			
Effective storage depth (100%)	0.90		
Effective storage depth (75%)	0.68		
Effective storage depth (50%)	0.45		
Effective storage depth (25%)	0.23		
Outflow Time (min)			
Time for measured outflow	276		
Time for 100% outflow	930		
Time for 75-25% outflow	410		
Volume of Outflow (m^3)			
Over measured effective depth	0.78		
Over 100% effective depth	1.76		
From 75% - 25% effective depth	0.88		
Surface Area (m^2)			
For 100% effective storage	8.26		
For 50% effective storage	5.11		
Over measured depth	4.76		
Soil Infiltration Rate (m/s)	**Cycle 1**	**Cycle 2**	**Cycle 3**
Over 100% effective depth	3.8E-06		
Over measured depth	9.9E-06		
Over 75% - 25% effective depth	**7.0E-06**		



Intégral Géotechnique

BRE365 SOIL INFILTRATION RATE TEST - TP06

12604 Sandy Lane, Ystradowen

Trial Pit Information	
Length (m)	2.80
Width (m)	0.70
Depth (m)	2.10
Groundwater	Dry
Weather Conditions	Dry
Date	05-Feb-20

Remarks
Note trendline extrapolated in order to derive soil infiltration rate
Actual infiltration over the same time period may vary
Unable to complete second and third test cycles in the time available

Cycle 1		Cycle 2		Cycle 3	
Time (min)	Depth (m)	Time (min)	Depth (m)	Time (min)	Depth (m)
0	0.60				
1	0.64				
2	0.65				
48	0.78				
88	0.84				
159	0.96				
250	1.06				

Final Excavation Depth (m)	Cycle 1	Cycle 2	Cycle 3
At end of testing cycle	2.10		
Water Depths (m)			
Water depth at start of test	0.60		
Water depth at end of test	1.06

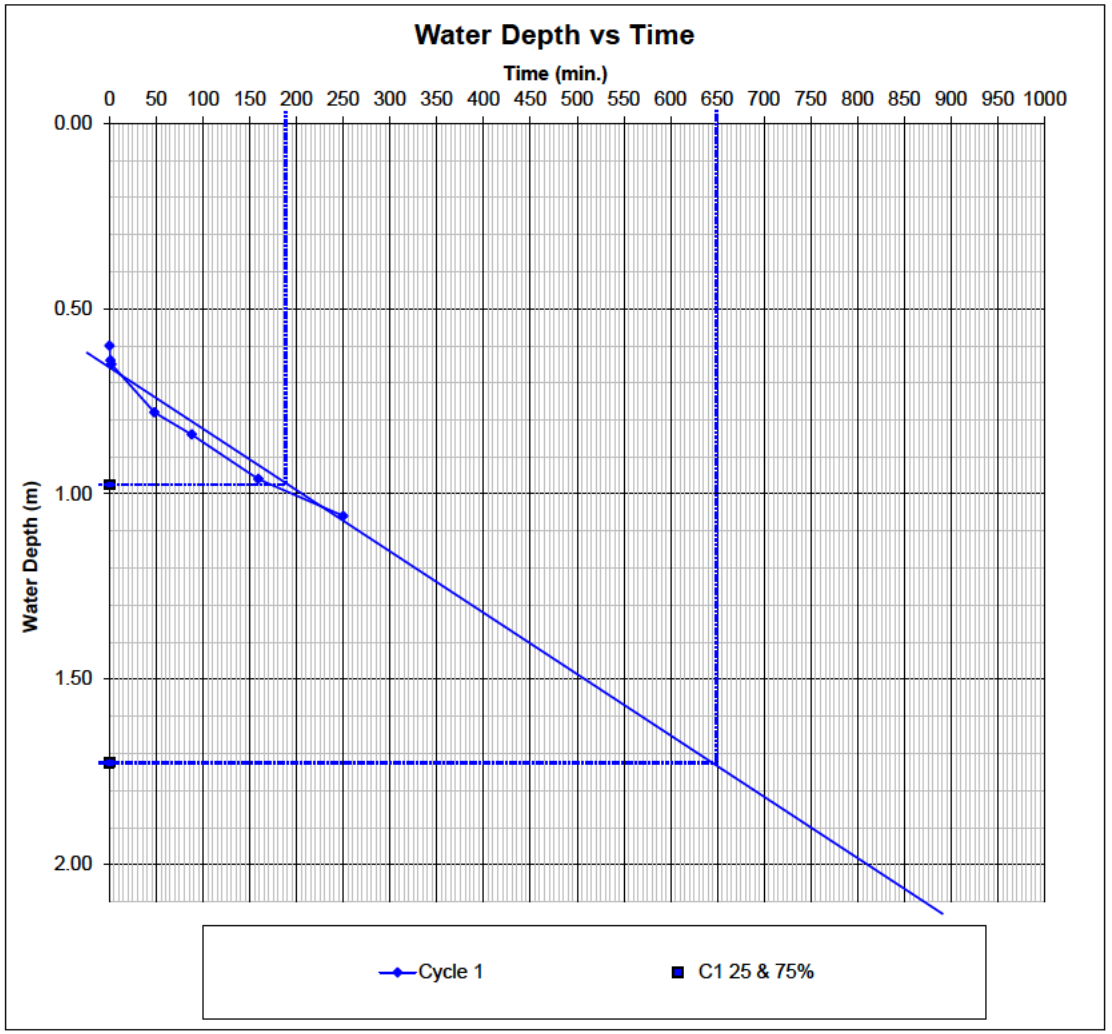
Over 75% - 25% effective depth	7.4E-06		



Intégral Géotechnique

BRE365 SOIL INFILTRATION RATE TEST - TP05A

12604 Sandy Lane, Ystradowen

Trial Pit Information	
Length (m)	2.50
Width (m)	0.70
Depth (m)	1.50
Groundwater	1.5
Weather Conditions	Dry
Date	05-Feb-20

Remarks

At end of test, trial pit depth was 0.8m due to spalling of pit sides.

Cycle 1		Cycle 2		Cycle 3

Technical Reviewer (Reporting Team)
For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

Any assessments of compliance with specifications are based on actual analytical results with no contribution from uncertainty of measurement. Application of uncertainty of measurement would provide a range within which the true result lies. An estimate of measurement uncertainty can be provided on request.

Project / Site name: Sandy Lane, Ystradowen

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
1436143	TP03	None Supplied	0.10	Brown loam and clay with gravel and vegetation.
1436144	TP03	None Supplied	0.40	Brown loam and clay with gravel and vegetation.
1436145	TP05	None Supplied	0.10	Brown loam and clay with gravel and vegetation.
1436146	TP05	None Supplied	0.40	Brown loam and clay with gravel and vegetation.

Analytical Report Number : 20-85651

Project / Site name: Sandy Lane, Ystradowen

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Boron, water soluble, in soil	Determination of water soluble boron in soil by hot water extract followed by ICP-OES.	In-house method based on Second Site Properties version 3	L038-PL	D	MCERTS
Hexavalent chromium in soil	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS
Loss on ignition of soil @ 450oC	Determination of loss on ignition in soil by gravimetrically with the sample being ignited in a muffle furnace.	In house method.	L047-PL	D	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically. (30 oC)	In house method.	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In house method.	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In house method.	L038-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In house method.	L009-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In house method.	L038-PL	D	MCERTS
Total Sulphur in soil	Determination of total sulphur in soil by extraction with aqua-regia, potassium bromide/bromate followed by ICP-OES.	In house method.	L038-PL	D	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

Analytical Report Number : 20-89049

Project / Site name: Sandy lane, Ystradowen

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
1453568	TP3A	None Supplied	0.40	Brown clay and sand with gravel.
1453569	TP3B	None Supplied	0.40	Brown clay and sand with gravel and vegetation.
1453570	TP3C	None Supplied	0.40	Brown clay and sand with gravel and vegetation.
1453571	TP3D	None Supplied	0.40	Brown sand with gravel and vegetation.

Analytical Report Number : 20-89049

Project / Site name: Sandy lane, Ystradowen

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Moisture Content	Moisture content, determined gravimetrically. (30 oC)	In house method.	L019-UK/PL	W	NONE
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

Head of Reporting Section

For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

Any assessments of compliance with specifications are based on actual analytical results with no contribution from uncertainty of measurement. Application of uncertainty of measurement would provide a range within which the true result lies. An estimate of measurement uncertainty can be provided on request.
